Improved prompts
1. Improved Prompt (The "Gemini" Version)
Copy and paste this into Google Gemini to further refine your app's logic or generate code snippets.
System Role: You are an expert Full-Stack Developer specializing in Flutter/Firebase and React/Firebase.
Project Name: NEU Laboratory Usage Log
Objective: Build a web/mobile application to track faculty laboratory usage via QR Code, RFID simulation, and Google SSO.
User Personas:

1. Professor: Accesses the room by scanning a QR/RFID or logging in via Google Institutional Email. Receives a confirmation message.
2. Admin: Oversees the entire system via a dashboard with analytics, logs, and user management.

Core Features & Technical Requirements:

- Authentication: Integration with Firebase Auth for Google Institutional Login.
- Input Methods:
    - QR Code Scanner (Camera access).
    - RFID Simulation (A manual input field or button trigger for prototype testing).
-
- Professor Workflow: After successful identification, check the user into a specific Room_ID. Display: "Thank you for using Room [Room Number]."
- Admin Dashboard Requirements:
    - Summary Statistics: Visual cards showing: Total Sessions Today, Most Used Room, Currently Active Rooms, and Blocked Users.
    - Usage Logs: A searchable data table with filters for: Professor Name, Date Range (Daily/Weekly/Monthly/Custom), and Room Number.
    - User Management: Ability to toggle a "Blocked" status for specific professor accounts in Firestore.
-

UI/UX Preferences:

- Clean, professional UI using Material Design 3.
- Theme: NEU Institutional colors (if applicable) or a clean Blue/White professional palette.
- Responsive layout for both Desktop (Admin) and Mobile (Professor).

---

2. UI Drafting (Instructions for Google AI Studio)

When you go to Google AI Studio, use the following specific instructions to generate your UI components.
For the Professor Login Screen:
"Generate a UI layout for a mobile-first login screen. Include a large 'Scan QR Code' button input field, and a 'Sign in with Google' button. Use a clean, modern aesthetic with plenty of white space."
For the Admin Dashboard:

"Generate a dashboard layout for a web app. The top should have four 'Stats Cards' (Total Logs, Active Professors, Most Used Lab, Blocked Users). Below that, a high-density data table for usage logs with a search bar and a date-range picker filter."

---

3. Firebase Studio Implementation (Data Structure)

When you feed the prompt into Firebase Studio or manually configure your database, use this Firestore Schema:

Collection:

- uid: String (Primary Key)
- name: String
- email: String (Google Email)
- role: String ("Professor" or "Admin")
- isBlocked: Boolean
- qrCodeData: String (Unique ID linked to their ID card)

Collection:

- logId: String
- professorId: Reference (Points to users)
- professorName: String
- roomNumber: String
- timestampIn: Timestamp
- timestampOut: Timestamp
- duration: Number (minutes)

Collection:

- roomId: String
- roomName: String
- status: String ("Occupied", "Available")

---

4. Logic for "QR Simulation"

Since physical QR reading requires specific hardware drivers (Web API), for your March 2026 project, use this logic in your code:

codeJavaScript

```javascript
// Example QRSimulation Logic
const simulateQR = (qrSerial) => {
  const user = findUserByQR(qrSerial);
  if (user.isBlocked) {
    alert("Access Denied: Account Blocked.");
  } else {
    logUsage(user.uid, "Lab 402");
    alert(`Thank you for using Room 402, Professor ${user.name}!`);
  }
}
```

Next Steps for You:

1. Open Google AI Studio: Use the UI prompts from Step 2 to get your CSS/HTML or Flutter code.
2. Open Firebase: Create a project named "NEU-Lab-Log."
3. Refine with Gemini: Ask Gemini, "Write a Firestore Security Rule that allows only Admins to change the 'isBlocked' status of a user."
4. Connect: Paste the generated code from AI Studio into your IDE and link the Firebase Config.
